About Lean

Lean thinking maximises customer value while minimising waste. Viewed simplistically lean thinking increases value for the customer while employing fewer resources and creating less waste.

A lean enterprise optimises entire value streams across technology, resource, supplier, and management boundaries to deliver maximum value to the customer. Lean processes require less resource, less effort, less space, and less time to deliver the same or better product increasing value and reducing cost.

Lean Construction is the application of lean thinking to the design and construction process. The links below provide more information on lean construction as well as how lean construction supports sustainability.
